RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 330 pages. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1949 Excerpt: . . . eastward or southeastward change in the basal zones from coarse to fine facies is available, however, in more distant southeastern localities. Toward the extreme headwaters of the Holokuk River, where there is no evidence of faulting, shales seem to predominate in the relatively few available exposures that adjoin the anticlinal area of the Gemuk group on Atsaksovlik Creek. Massive shales, accompanied by minor amounts of graywacke, also crop out in an anticlinal belt in a large upfaulted block along the headwater divide between Boss and Egozuk Creeks, tributaries of the Holokuk River, and Mukslulik and Bakbuk Creeks, northwestern tributaries of the Holitna River. The rocks of the basal zones of the Kuskokwim group, such as are found in the upper Holokuk River area, are massive and weather brown. In this they differ from rocks of both higher zones and of apparent lateral equivalents of the basal zones in southeastern areas. The thick massive beds form prominent outcrops that stand out from the slopes much like the massive strata of the Gemuk group in the Cinnabar Creek area. The brown color gives the superficial appearance of weathered mafic volcanic rocks, and hand specimens of the finer textured facies are difficult to distinguish from basalt. Actually, those rocks of northwestern areas commonly contain such large quantities of fragmental debris, apparently derived from the basaltic volcanic formations in the Gemuk group, that they approach the composition of basalt or andesite and the brownweathered surface is explained. The strata in some localities may be crossed...
